

Follow every steps in the Video!

You must use this program only in MacOS Sierra 10.12 for the first part of this program.
To deploy MacOS Sierra on a Volumes, have to do it in macOS Sierra

The installation time is about 15 minutes depending on the speed of your disk and your system.

The second part of the program will be done on the new volume that will be deployed,

This will last about 2 minutes with Apple's startosinstall tools which is integrated into Install macOS High Sierra.app.

Since Sierra 10.12.3 Apple has changed the tools and it is no longer possible to do so on a selective volume. Have to do it on the Main Disk,
that's why we created our disk Main in the first part.

Welcome
Installer MacOS Sierra HD-X

This will Deploy MacOS Sierra on
your selected Volume.

-----Important-----
Format your SSD with Disk Utility

You need an SSD or HD virgin
Before using the program!
You need Installer MacOS Sierra.app
